

PREMIN® ANTISTERIL 2010

Good reproduction parameters and health calves rearing are two basic presumptions for effective dairy cattle breeding. Therefore, top dairy farmers apply Premin® Antisteril two weeks before calving and during the first third of lactation. It contains minerals, microelements, vitamins and ß-caroten.

IMPORTANCE:

- specially formulated vitamin-mineral feed to improve reproduction parameters
- decreases post-partum disorders
- minimises afterbirth placenta retention
- supports physiologic uterus involution
- improves ovarial function and heat induction
- reduces appearance of ovary atrophy and ovarian cyst syndrom
- supports immune system of the animal
- reduces appearance of ketosis and endrometris
- supplements highly bioavailable microelements
- has antioxidant effect
- contains CLA, β-caroten, vitamins A, D3 and E

Better reproduction parameters

APPLICATION INDICATIONS:

- poor reproduction parameters
- problems with urogenital system
- metabolic disorders

COMPOSITION:

vitamins A, D3 and E, niacin, ß-caroten, organic Selenium, organic microelements, macroelements, CLA

DOSAGE:

50 - 100 g per head per day

RECOMMENDATION:

- in a dry and transition period 3 weeks before and 3-4 weeks after calving
- during the first third of lactation
- apply to all cows for 1-2 months when health problems are indicated
