IMPORTANCE:

On today's market, there is a growing demand for high milk production, milk fat and fat-soluble vitamins. Simultaneously, it is important to ensure excellent herd fertility. To achieve these goals, breeders use C 16 – a fat protected against rumen degradation. It increases energy intake, decreases appearance of the lipomobilisation syndrome of dairy cows in the first part of lactation as well as weight losses. From preventing production diseases point of view, C 16 contributes to reduction of ketosis, hepatosteatorrhea and hepatic coma, rumen dysfunctions and infectious diseases. It reduces appearance of ovary atrophy and ovarian cyst syndrome.

FEEDING INSTRUCTIONS

200 – 500 g per head and day for dairy cows in the first third to half of lactation.
